Topic and Research Question

How can cities use Flock cameras to address traffic violations and support regional development? Traffic violations can contribute to crashes, congestion, and unsafe streets, affecting residents, businesses, and transportation infrastructure. Flock cameras use license plate recognition technology to help law enforcement identify vehicles and investigate incidents. Examining how this technology can support traffic safety may help cities understand how safer roads can improve accessibility, attract businesses, and support long-term urban growth.

Route and Rationale

I propose a policy report because this topic connects traffic enforcement with broader urban and economic development. The report will examine how Flock cameras could support traffic safety efforts and how reducing dangerous driving may benefit local communities and businesses. It will also consider privacy concerns, implementation costs, and whether camera use produces measurable improvements. The report will recommend policies that connect responsible technology use with transportation planning and regional development goals.

Data and Tools

I will use publicly available information from city government websites, police department policies, Flock Safety, transportation agencies, and traffic safety reports. I will examine traffic crash statistics, regional transportation plans, and existing camera policies. I will use online research and a word processor to organize the evidence and develop policy recommendations.
